

Thoughts about CoolStance and Toxins

by Claudia Garner

These are my own personal thoughts and observations.

All of our horses are suffering from toxic overload. Toxins compel the cells in the body to hold onto water and weight gain is inevitable in toxic bodies. Toxins are in the water, in the hay supply from chemical fertilization, herbicides and pesticides and in the commercially produced feeds, as they are not made with quality ingredients and do, at least in the US, not have any regulating oversight in their manufacturing process, which means the manufacturer can throw in whatever is cheapest on the market that day and as long as it tests out as (for example) 10% protein, it's all legal and good.

CoolStance is a bit different as it has no ingredient list. It is 100% copra meal. Copra meal is derived from the process of producing coconut oil: The husk of the coconut is removed, the shell split with a machete, and the white flesh exposed to the sun for a couple of days. Then the white flesh is extracted, heated up carefully and pressed, so the precious oil can be obtained. What is left over in this process is named copra meal. It contains a rest oil of about 10%, has about 20% protein and is very rich in medium chain triglycerides (MCT). This gets bagged and shipped to the US. Our coconut processor in the Pacific Islands is established as a sustainable system. There is no negative impact on the environment (as can be with palm kernel production). As a side note our processor provides major support to the local communities and had even built a school for children of the workers.

CoolStance is real clean feed.

Sometimes a horse may seem to lose weight when transitioning to CoolStance. This weight loss comes in my humble opinion from the detoxifying properties of the coconut meal and oil. This is a fat the body can work with. If you have a horse that needs to gain weight, you have to feed more of it, and probably get a decent dentist to see the horse, one who takes care of balancing the mouth. Also the hooves have to be in good shape and so on. This is a whole horse approach. I have put weight on horses with CoolStance and I have taken weight off horses with CoolStance. An individual sensible profile has to be established before any guarantees can be made.
